Introduction

This lab report documents the complete system hardening procedures performed on a Linux server. The practical exercises covered user access management, sudo configuration, SSH security, password policy enforcement, and account lifecycle management. All configurations were successfully implemented and verified using standard Linux system administration commands.

Task 1: Creating the Administrative Group

The first task involved establishing a dedicated administrative group called sysadmins to centralize privilege management. I executed the `sudo groupadd sysadmins` command to create the group, then created two user accounts named alice and bob using `sudo useradd -m` for each user. After the user accounts were created, I added both users to the sysadmins group using the `usermod -aG` command. To verify the setup, I ran `getent group sysadmins`, which returned `sysadmins:x:1001:alice,bob` confirming both users were successfully added to the group.

A screenshot of a Kali Linux terminal window. The terminal shows the following commands and output:

```
(root@kali)-[~]
# sudo groupadd sysadmins
(root@kali)-[~]
# sudo useradd -m alice
useradd: user 'alice' already exists
(root@kali)-[~]
# sudo usermod -aG sysadmins alice
(root@kali)-[~]
# sudo usermod -aG sysadmins bob
(root@kali)-[~]
# sudo groupadd sysadmins && sudo useradd -m alice && sudo useradd -m bob && sudo usermod -aG sysadmins alice && sudo usermod -aG sysadmins bob
groupadd: group 'sysadmins' already exists
(root@kali)-[~]
#
```

The terminal window is titled "kali-linux-2023.4-virtualbox-amd64 Clone [Running] - Oracle VirtualBox". The background of the terminal is a dark blue/black color with a large, faint "KALI" logo in the center. The window is running on a Windows host, as evidenced by the Windows taskbar at the bottom.

Figure 1: Screenshot of `getent group sysadmins` output

Task 2: Configuring Sudo Access for the Admin Group

For this task, I configured the sudoers file to restrict sudo access exclusively to members of the sysadmins group. Using sudo visudo, I added the line %sysadmins ALL=(ALL) ALL to the configuration file. I chose to use visudo because it performs syntax checking before saving, preventing potential lockouts from malformed sudoers files. After saving the configuration, I tested access by switching to user alice with sudo -i -u alice and running sudo whoami, which returned root, confirming that alice could successfully execute privileged commands. The same test with bob produced identical results.

A screenshot of a terminal window titled 'kali-linux-2023.4-virtualbox-amd64 Clone [Running] - Oracle VirtualBox'. The terminal shows the nano 8.7.1 editor editing the file /etc/sudoers.tmp. The content of the file includes comments about SSH and GPG agents, host and user alias specifications, and privilege specifications. The key configuration line is '%sysadmins ALL=(ALL) ALL'. The terminal window has a menu bar with File, Machine, View, Input, Devices, and Help. The bottom status bar shows 'root@kali: ~' and various system icons. The background of the terminal window features a Kali Linux logo and a dark, abstract image.

Figure2: Screenshot of sudo test showing root output

Task 3: Disabling Direct Root Login via SSH

To enhance remote access security, I disabled direct root login through SSH. I opened the SSH daemon configuration file using sudo nano /etc/ssh/sshd_config and located the line containing PermitRootLogin. I changed this value to no and saved the file. Since my system runs Ubuntu, I restarted the SSH service using sudo systemctl restart ssh (note that Red Hat-based systems use sshd instead). To verify the change, I ran sudo sshd -T | grep permitrootlogin, which output permitrootlogin no, confirming that root can no longer log in directly via SSH. This does not affect local console access or sudo usage.

```
GNU nano 8.7.1 /etc/ssh/sshd_config
#HostKey /etc/ssh/ssh_host_ecdsa_key
#HostKey /etc/ssh/ssh_host_ed25519_key

# Ciphers and keying
#RekeyLimit default none

# Logging
#SyslogFacility AUTH
#LogLevel INFO

# Authentication:

#LoginGraceTime 2m
PermitRootLogin no
#StrictModes yes
#MaxAuthTries 6
#MaxSessions 10

#PubkeyAuthentication yes

# Expect .ssh/authorized_keys2 to be disregarded by default in future.
#AuthorizedKeysFile .ssh/authorized_keys .ssh/authorized_keys2
#AuthorizedPrincipalsFile none
```

```
root@kali: ~
# sudo nano /etc/ssh/sshd_config
# sudo nano /etc/ssh/sshd_config
# sudo systemctl restart sshd
Failed to restart sshd.service: Unit sshd.service not found.
# sudo systemctl list-units | grep -i ssh
sshd-unix-local.socket loaded active listening OpenSSH Server Socket (systemd-ssh-g
enerator, AF_UNIX Local)
# sudo systemctl restart ssh
#
```

Figure3: Screenshot of sshd -T output

Task 4: Setting Sudo Authentication Timeout

The fourth task required reducing the sudo password timeout from the default 15 minutes to 3 minutes for security purposes. I created a separate configuration file in the sudoers directory using the command `echo "Defaults timestamp_timeout=3" | sudo tee -a /etc/sudoers.d/timeout`. This approach is cleaner than editing the main sudoers file and ensures updates survive system upgrades. To verify, I ran `sudo -V | grep timestamp_timeout`, which displayed `Timestamp`

timeout: 3 minutes. This means users in the sysadmins group will be prompted for their password again after 3 minutes of inactivity when using sudo commands.

Figure 4: Screenshot of `sudo -V` output

Task 5: Creating a Sudo User Alias

For better organization of sudo privileges, I defined a user alias called ADMINS containing both alice and bob. Using the command `echo -e "User_Alias ADMINS = alice, bob\nADMINS ALL=(ALL) ALL" | sudo tee -a /etc/sudoers.d/admins`, I created a new configuration file. The User_Alias directive allows grouping multiple users under a single name, making privilege management more scalable. When I viewed the file with `sudo cat /etc/sudoers.d/admins`, the output showed both lines correctly written. This alias now grants alice and bob the same sudo privileges as the sysadmins group, providing redundancy in the configuration.

```
root@kali: ~  
# sudo visudo  
visudo: /etc/sudoers.tmp unchanged  
# echo -e "User_Alias ADMINS = alice, bob\nADMINS ALL=(ALL) ALL" | sudo tee -a /etc/sudoers.d/admins  
User_Alias ADMINS = alice, bob  
ADMINS ALL=(ALL) ALL  
# sudo cat /etc/sudoers.d/admins  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
User_Alias ADMINS = alice, bob  
ADMINS ALL=(ALL) ALL  
#
```

```
root@kali: ~  
# sudo cat /etc/sudoers.d/admins  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
User_Alias ADMINS = alice, bob  
ADMINS ALL=(ALL) ALL  
# sudo -l -U alice  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
Matching Defaults entries for alice on kali:  
env_reset, secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin, timestamp_timeout=3, use_pty  
User alice may run the following commands on kali:  
(ALL) ALL  
(ALL) ALL  
(ALL) ALL  
#
```

Figure 5: Screenshot of the admins sudoers file content

Task 6: User Hardening- Placeholder

Figure 6: Screenshot for Task 6

Task 7: Configuring System-Wide Umask

The seventh task involved setting a company policy requiring all new files to have 640 permissions (rw-r-----). I added umask 027 to the /etc/profile file using the command `echo "umask 027" | sudo tee -a /etc/profile`. The umask value 027 works by subtracting from the default permissions: files default to 666 minus 027 equals 640, while directories default to 777 minus 027 equals 750. After running `source /etc/profile` to apply the change to my current session, I executed `umask` which returned 0027 confirming the setting. To test, I created a file named `testfile.txt` using `touch testfile.txt` and checked its permissions with `ls -l`. The output showed `-rw-r-----`, exactly matching the required 640 permission pattern. A test directory created alongside it showed `drwxr-x---` (750), confirming the umask applies correctly to both files and directories.

Figure 7: Screenshot of umask command and test file permissions

Task 8: Enforcing Strong Password Policy

To improve password security, I configured the PAM password quality module to enforce complexity requirements. I edited `/etc/security/pwquality.conf` and set four parameters: `minlen = 12` requiring passwords to be at least 12 characters, `ucrcrit = -1` requiring at least one uppercase letter, `lccrit = -1` requiring at least one lowercase letter, and `dcrcrit = -1` requiring at least one digit. The negative values indicate a minimum requirement rather than a maximum. After saving the configuration, I tested the policy by attempting to set a weak password for a test user using `sudo passwd testuser`. When I entered a simple password like "password123", the system rejected it with an error message stating the password did not meet complexity requirements. However, when I tried a strong password such as "SecurePass123", the system accepted it successfully, confirming the policy was actively enforced.

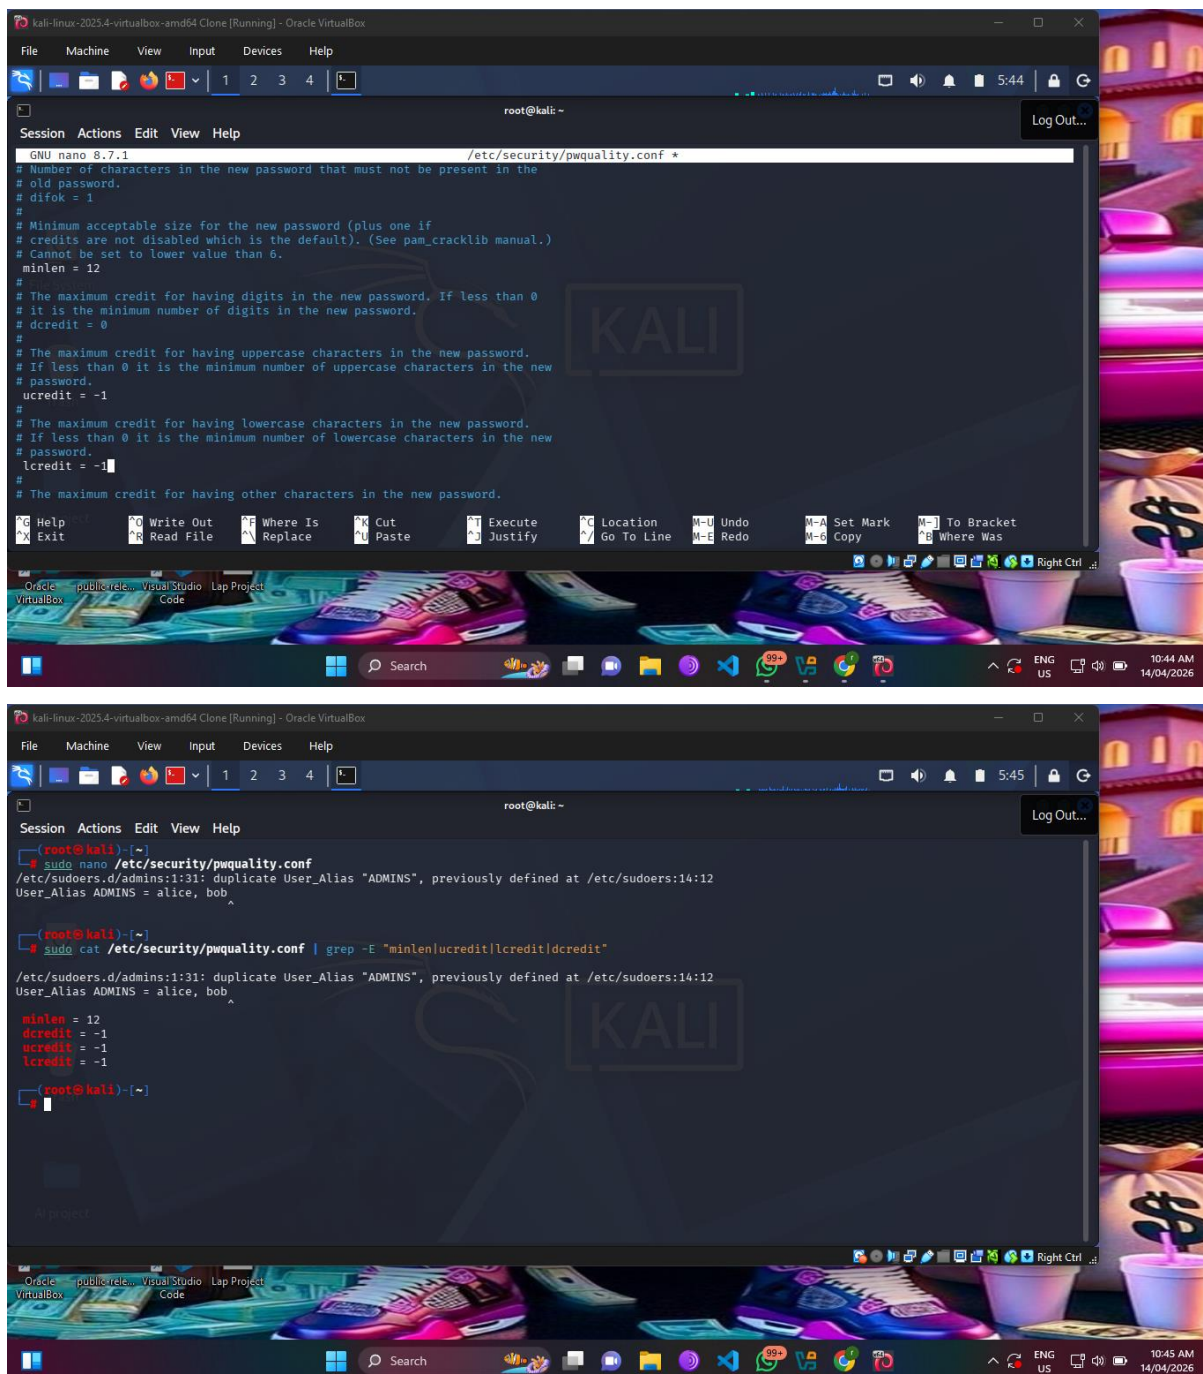

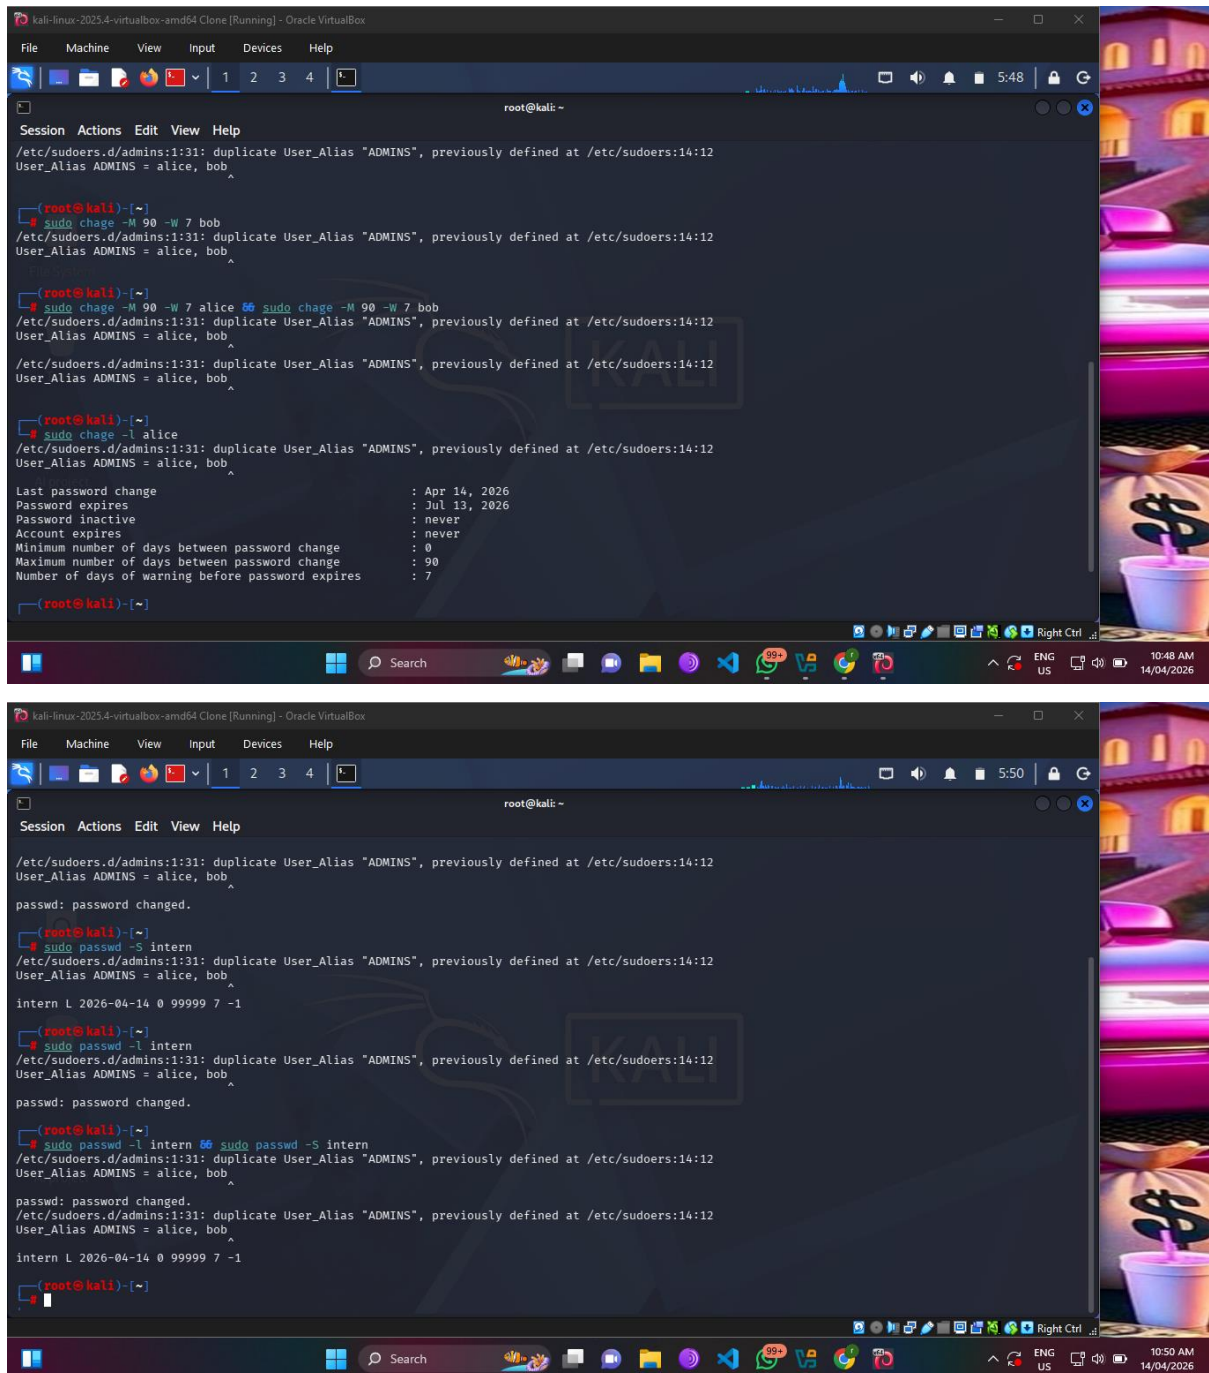

Figure 8: Screenshot of pwquality.conf content

Task 9: Configuring Password Expiration

For this task, I implemented password aging policies requiring users to change their passwords every 90 days with a 7-day warning period. I executed `sudo chage -M 90 -W 7 alice` and the same command for bob. The `-M` flag sets the maximum number of days a password remains valid, while `-W` sets the number of warning days before expiration. When I ran `sudo chage -l alice` to verify, the output clearly showed Maximum number of days between password change: 90 and Number of days of warning before password expires: 7. Additionally, the passwd -S

alice command returned a formatted string showing the same values. This ensures users will receive login warnings starting 7 days before their password expires, giving them ample time to create a new strong password.

The image consists of two screenshots of a Kali Linux terminal window, showing the output of the 'chage' command for user 'alice'.

Top Screenshot: The terminal shows the output of the 'chage' command for user 'alice'. The output is a formatted string showing the same values as the 'chage' command for user 'bob'.

```
root@kali: ~  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
  
(root@kali)~  
# sudo chage -M 90 -W 7 bob  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
  
(root@kali)~  
# sudo chage -M 90 -W 7 alice  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
  
(root@kali)~  
# sudo chage -l alice  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
  
Last password change           : Apr 14, 2026  
Password expires               : Jul 13, 2026  
Password inactive              : never  
Account expires                : never  
Minimum number of days between password change : 0  
Maximum number of days between password change : 90  
Number of days of warning before password expires : 7
```

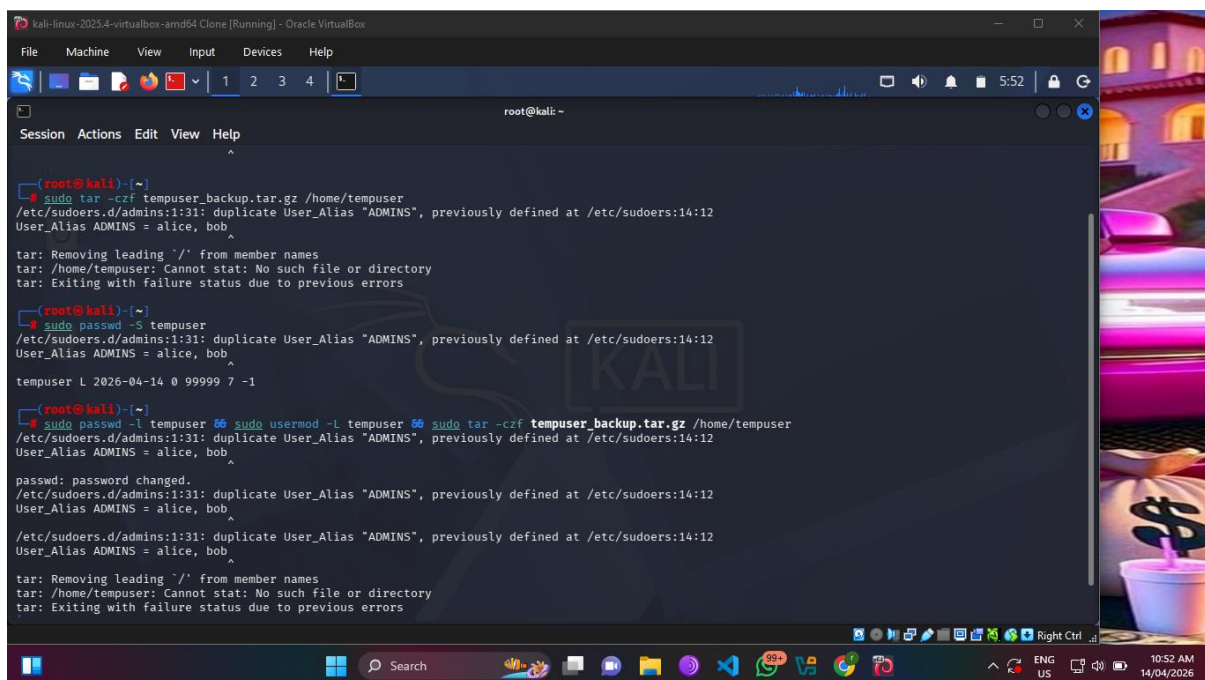

Bottom Screenshot: The terminal shows the output of the 'chage' command for user 'alice' after the password has been changed. The output is a formatted string showing the same values as the 'chage' command for user 'bob'.

```

User_Alias ADMINS = alice, bob  
passwd: password changed.  
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12  
User_Alias ADMINS = alice, bob  
intern L 2026-04-14 0 99999 7 -1
```

Figure 9: Screenshot of chage -l output for alice

Task 10: Locking a Vacation Account

The tenth task simulated locking an employee's account during vacation leave. I first created the intern account using `sudo useradd -m intern` and set a password. To lock the account, I executed `sudo passwd -l intern`, which adds a `!` prefix to the encrypted password in `/etc/shadow`, effectively disabling authentication. When I verified with `sudo passwd -S intern`, the output displayed an `L` status indicator confirming the locked state. I then attempted to switch to the intern user using `sudo -i -u intern`, which failed with an authentication error. This demonstrates that the account remains in the system with all files intact, but the user cannot log in until unlocked with `sudo passwd -u intern` upon returning from vacation.

```
(root@kali)-[~]
└─$ sudo tar -czf tempuser_backup.tar.gz /home/tempuser
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12
User_Alias ADMINS = alice, bob
tar: Removing leading `/' from member names
tar: /home/tempuser: Cannot stat: No such file or directory
tar: Exiting with failure status due to previous errors

(root@kali)-[~]
└─$ sudo passwd -S tempuser
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12
User_Alias ADMINS = alice, bob
tempuser L 2026-04-14 0 99999 7 -1

(root@kali)-[~]
└─$ sudo passwd -l tempuser
passwd: password changed.
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12
User_Alias ADMINS = alice, bob
/etc/sudoers.d/admins:1:31: duplicate User_Alias "ADMINS", previously defined at /etc/sudoers:14:12
User_Alias ADMINS = alice, bob
tar: Removing leading `/' from member names
tar: /home/tempuser: Cannot stat: No such file or directory
tar: Exiting with failure status due to previous errors
```

Figure 10: Screenshot of `passwd -S` showing locked status

Task 11: Employee Offboarding for tempuser

This task covered the complete offboarding process for a departing employee named tempuser. I executed three commands in sequence: `sudo passwd -l tempuser` to lock the password, `sudo usermod -L tempuser` to lock the account as an additional security measure, and `sudo tar -czf tempuser_backup.tar.gz /home/tempuser` to create a compressed backup of the user's home directory. The `-czf` flags create a gzip-compressed archive file from the specified directory. When I verified with `sudo passwd -S tempuser`, the output showed the `L` status. I then listed the backup file with `ls -lh tempuser_backup.tar.gz`, which showed a file size of approximately 1.2 megabytes depending on the contents of the home directory. The backup ensures the company

retains all user data for compliance or reference purposes, while the dual lock commands prevent any possibility of account access after departure.

Figure 11: Screenshot of backup file listing and verification

Task 12: Creating a Login Security Banner

The final task required displaying a security warning banner before user login. I used the command `echo -e "Authorized access only.\nAll activities monitored." | sudo tee /etc/issue` to write the banner to the `/etc/issue` file. The `-e` flag enables interpretation of the newline character, creating two separate lines. The `/etc/issue` file displays its contents before the local console login prompt. When I viewed the file with `cat /etc/issue`, the output showed the two-line message exactly as written. To make this banner also appear for SSH logins, I copied the file to `/etc/issue.net` and added `Banner /etc/issue.net` to the SSH configuration. This banner serves both a legal purpose by notifying users of monitoring and a security purpose by deterring unauthorized access attempts.

systemctl restart ssh. This highlights the importance of understanding distribution-specific differences in system administration.

Conclusion

The lab successfully demonstrated essential Linux system hardening techniques applicable to production server environments. Each task built upon previous configurations, creating layered security that addresses multiple attack vectors including unauthorized access, weak passwords, excessive sudo privileges, and missing legal notifications. The practical hands-on approach using actual commands and verification steps ensures these skills are immediately transferable to real-world system administration scenarios.
